Experience

Software engineer

Algosec

since November 2021

My main responsibilities are designing and implementing cloud solutions for one of the Algosec's products based on microservices architecture running inside Kubernetes using AWS services.

Java Software Developer

ObjectStyle

September 2017 - November 2021

Project for USA based 100 year old company which offers a wide range of public record search services and performs foreclosure reviews as well as document filing procedures. My main tasks were architecture designing and business logic implementation, performance issues and optimizations, developing infrastructure, continuous integration, devops issues, maintaining.

Education

Bachelor of mathematics and economics.

2015 - 2019

BSU, Faculty of Applied Math and Computer Science, Economic Cybernetics department.

Other activity

Blockchain enthusiast

Blockchain

I really enjoy to work with Blockchain technologies and services, currently it's a hobby for me. I launched few bots using Typescript, Ethers.js and other SDKs. Created, tested and deployed smart contracts for educational purposes using Solidity, Hardhat and OpenZeppelin.

Bot for travelling

Telegram/Java

Launched telegram bot for local travelling, which had more than 5k users.

Publications

Writing

Created few technical notes for [habr.com](#).

Contributions

Apache Cayenne

Apache Cayenne is an open source Java object relational mapping framework. I implemented new features, investigated and improved performance issues, faced with some non-trivial bugs. Got an Apache committer badge.

<https://cayenne.apache.org>

Bootique

Bootique is a minimally opinionated framework for runnable Java apps. Worked on several services for Bootique infrastructure and also contributed to the library itself.
